

Overlay Banner On App

1. Overview

The **Overlay Banner** is a floating banner that appears on the **Nykaa App** when a user opens the app. It is **exclusive to the app** and **not visible on MWeb or Desktop**. This banner primarily functions as a promotional takeover to highlight key campaigns or brand communications.

2. Behavior & Functionality

- When a user opens the app **for the first time**, a **large overlay banner** appears from the **bottom-left corner** of the screen.
 - Once dismissed, or after viewing, users subsequently see a **smaller version** of the overlay with a **close ('X') icon**.
 - After the large banner is shown once, it will **not reappear** unless the user **reinstalls the app**, which resets the display counter.
 - The overlay setup is **limited to app environments only** — not supported on **mweb or desktop**.
-

3. Overlay Setup in AdPlatform

- There are a total of **7 inventories** available for overlay setup in the [AdPlatform](#).
 - Out of these, **6 inventories** are used at a time.
 - The overlay configuration depends on the **wireframe type**:
 - If the layout follows a **column grid**, use the **column_grid** template for 3 sections.
 - If it follows a **sliding format**, use the **sliding_widget** template.
-

4. Page Type Convention

All overlay page types follow a **fixed naming convention**:

`app-{page_name}-takeover`

Examples:

- Homepage → [app-homepage-takeover](#)
 - Makeup → [app-makeup-takeover](#)
 - Hair → [app-hair-takeover](#)
-

5. Asset Breakdown

Each overlay consists of **6 creative assets**, structured as follows:

Asset Name	Section / Layer	Purpose
Background Image	middle-layer	Visual background for the banner
Area A (Top Creative)	hero-section	Main visual or highlight area
Area B (Logo + Content)	brand-text	Brand logo and tagline/message
Area C (Banner / Widget)	column_grid / sliding_widget	Product highlights or offers
Area D (Shop All CTA)	shop-now	Call-to-action directing users to shop
PIP (Picture-in-Picture)	pip-layer	Persistent small banner post initial view

7. Notes & Best Practices

- Ensure that only **required inventories** are active to prevent overlap.
- Validate the **page type naming format** before final setup.
- Always check for **proper layering** in the creative (hero, text, CTA, etc.).
- Run a **test on staging** before pushing the overlay live.
- Large banner visibility resets **only upon app reinstall**.
